

Consolidator+

MasterClass

Week 8 – Intermediate Configuration

Today's Key Topics

- How to Program “Soft Keys” on a Screen
- How to Configure “Alarms”
- How to Create a New “Color Scheme”
- How to Create Timers
- How to Tie a Physical Relay Output to a configured “Alarm”

ConsoliDator+

MasterClass

Configuring “Soft Keys” on a Screen

You can see at the bottom of this window a list of “Function Keys” (I call them “Soft Keys”)

Each Soft Key can be totally customized to perform various events

You see the default settings here. This is how EVERY screen will look unless they are changed

Screen 1

Title: 1. Name of Screen
Name for the screen, 23 characters max.

1. Level Channel
2. Flow Channel
3. pH Channel

Show Title
 Show Channel #
 Show Bargraphs
 Bargraphs Only
 Auto Scan
 Dwell Time

Add Insert Remove ↑ ↓

F1: Previous Screen
F2: Next Screen
F3: Scan / Stop
F4: Ack Alarm - All

New Copy Delete

Configuring “Soft Keys” on a Screen

When you select a Soft Key to edit, you will see this window.

You are looking at a list of different “Function Categories”

Each “Category” has a list of sub-categories from which you can choose

Screen 1

Title: 1. Name of Screen
Name for the screen, 23 characters max.

1. Level Select User Function
2. Flow None
3. pH C

Configuring “Soft Keys” on a Screen

For example, this image shows you all of the available sub-categories within the “Relay Category”

Screen 1

Title: 1. Name of Screen
Name for the screen, 23 characters max.

1. Level
2. Flow
3. pH C

Select User Function

- Relay
 - Reset Info
 - Rset Info (Confirm)
 - Force ON
 - Force OFF
 - Manual ON
 - Manual OFF
 - Hold (Manual)
 - Automatic
 - Manual ON / Auto
 - Manual OFF / Auto
 - Hold / Auto

Show Title
Show Channel #
Show Bargraphs
Bargraphs Only
Auto Scan
Dwell Time
Seconds: 5 + -

OK Cancel

New Copy Delete

Once you select which function (in this case, “Force ON”) you want, you simply choose which physical relay you want to control/configure

Screen 1

Title: 1. Name of Screen
Name for the screen, 23 characters max.

1. Level
2. Flow
3. pH C

Select User Function

- Relay - Force ON
 - RY-All
 - RY-1, 6a (Relay)
 - RY-2, 6b (Relay)
 - RY-3, 6c (Relay)
 - RY-4, 6d (Relay)
 - RY-5, 6e (Relay)
- Force OFF
- Manual ON

Show Title
Show Channel #
Show Bargraphs
Bargraphs Only
Auto Scan
Dwell Time
Seconds: 5 + -

OK Cancel

New Copy Delete

NOTE: for a detailed explanation of these functions, please refer to the “Study Guide” for this week.

How to Configure an “Alarm” (the BEST way)

Find “Alarms” on the right side of the window

Then press “New” and this window will appear

The screenshot displays the 'ALARMS SETTINGS OVERVIEW' interface. On the left, a navigation menu includes 'Channels' (Level, Flow, pH), 'Totals', 'Timers', 'Alarms' (highlighted), 'Inputs', 'Outputs', 'Screens', 'System', 'Production', and 'Sales'. A 'New' button is located in the top right corner of the overview panel. A 'New Alarm' dialog box is open, showing the following configuration options:

- Alarm:** 1 (dropdown)
- Display Tag:** A1 (text input, placeholder: Enter a name...)
- Color Scheme:** Default (dropdown)
- Type:** Single Source (dropdown)
- Input:** None (text input)
- Set Pt:** 7000.0 (text input)
- Reset:** 4000.0 (text input)
- Break:** Alarm Off (dropdown)
- On Delay:** 0.0 (text input)
- Off Delay:** 0.0 (text input)
- Checkboxes:** Sound Horn, Alert!, Automatic, Ack Anytime (all checked)
- Buttons:** Save, Cancel

NOTE: the “Set Pt” and “Reset” are automatically filled out with those numbers, and they are meant to be edited.

How to Configure an “Alarm” (the BEST way)

After that, you should...
NAME THE ALARM

Type – which type of alarm do you want to configure?

Single Source
Multi-Source
Interval
Alarms OR
Alarms AND
Day & Time

ALARMS SETTINGS OVERVIEW New

New Alarm [Close]

Alarm: 1

Display Tag: A1. Alarm Name Color Scheme: Default

Name for the Alarm, 15 characters max.

Type: Single Source

Input: 1. Level Channel

Set Pt: 80.0

Reset: 50.0

Break: Alarm Off

On Delay: 0.0

Off Delay: 0.0

Sound Horn
 Alert!
 Automatic
 Ack Anytime

Save Cancel

Input – What is going to be the input to this alarm? Usually it’s going to be a channel, like in this example.

Set Pt – At which point in the scale of your “Input” do you want the alarm to be active (or, “true”).

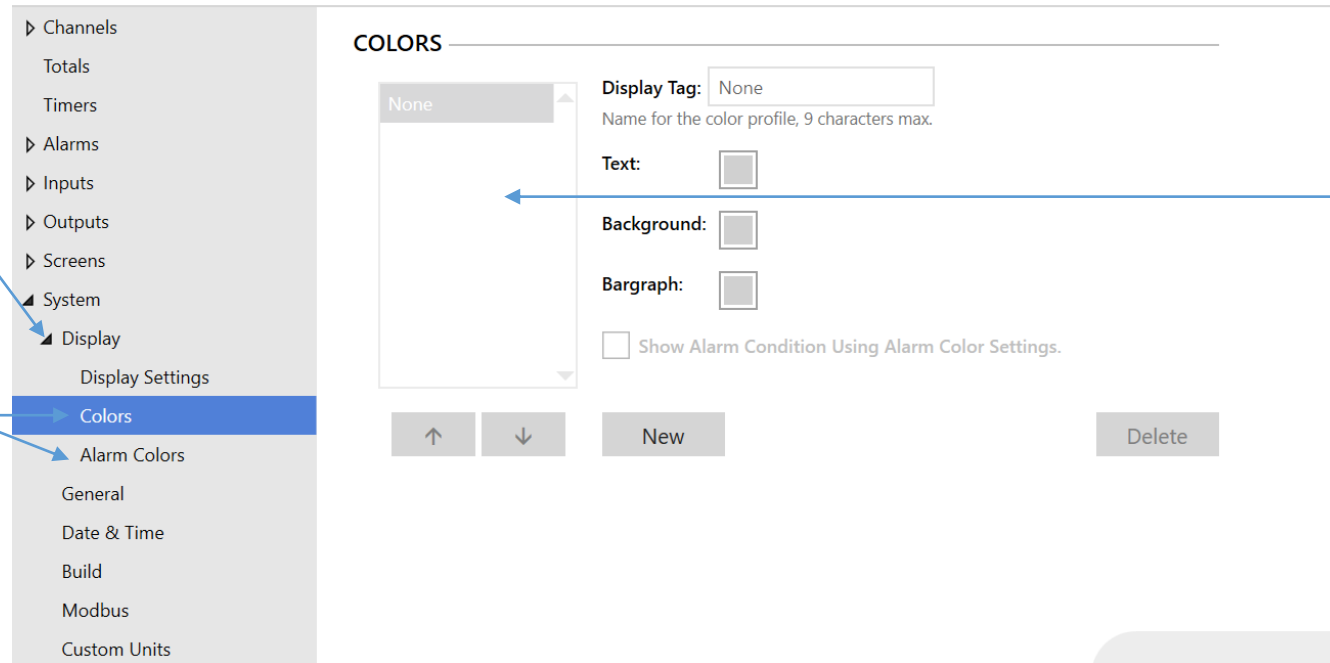

Reset – At which point in the scale of your “Input” do you want the alarm to reset, or become “False”.

NOTE: This is a single source alarm based off my “Level Channel”. When the tank is 80% full, my alarm is true. When the tank reaches 50% capacity, the alarm returns to “False” or “Inactive”

How to Create a New “Color Scheme”

On the left of the software window, find the “Display” option.

Within the “Display” option, you will see “Colors” and “Alarm Colors”

If you have any custom “Color Schemes” created on your unit, they will appear in this list

However, this is how the window appears when you are creating your first “Color Scheme”

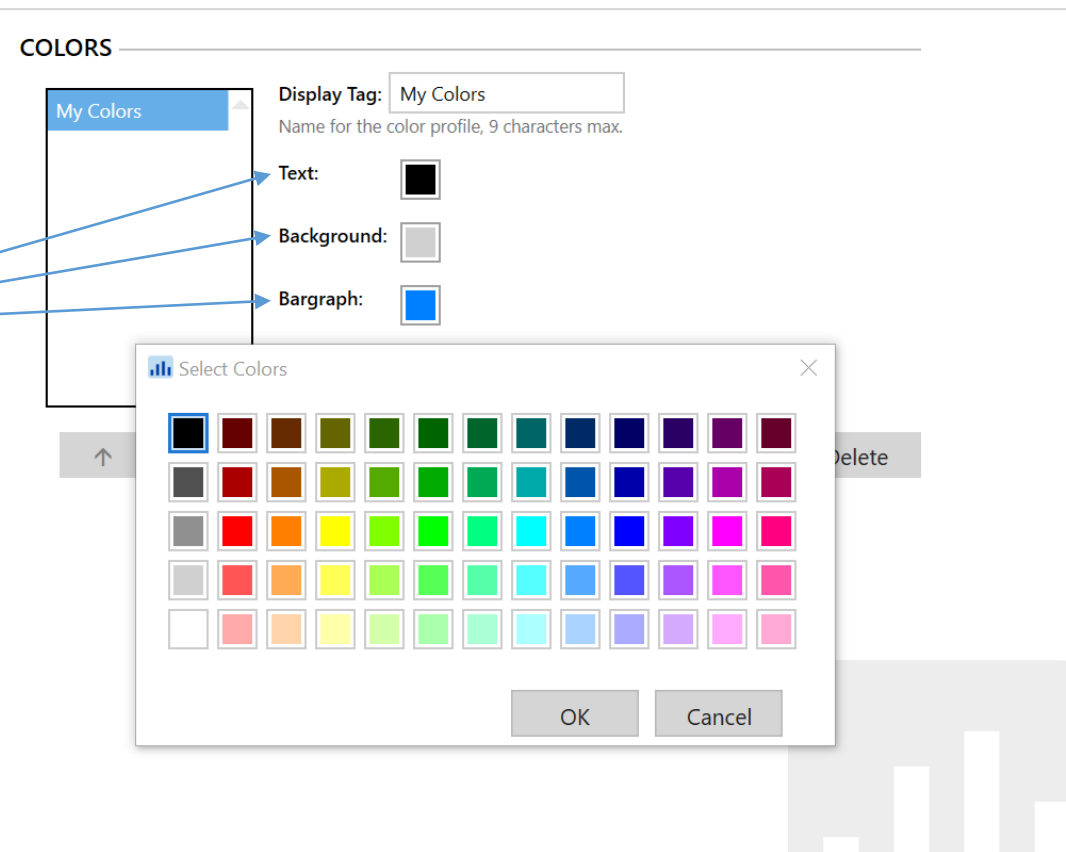

NOTE: The same process will work for both “Colors” (Channel colors) and “Alarm Colors”. They are simply stored in separate places

How to Create a New “Color Scheme”

You can edit the color of THREE things within a “Channel”.

Text
Background
Bargraph

*(you see the default color selection is **black text, grey background, and blue bargraph**)*

NOTE: *There are a total of 62 colors from which you can choose.*

How to Create a New “Color Scheme”

The last thing to do before finishing your color scheme, is to make sure this check box is “correct” for your particular application

COLORS

My Colors

Display Tag:
Name for the color profile, 9 characters max.

Text:

Background:

Bargraph:

Show Alarm Condition Using Alarm Color Settings.

↑ ↓ New Delete

With that box checked, the channel will change color on alarm (you’ve seen this in almost every class) which is usually what folks want.

However, you do have the option to NOT have the channel change color on alarm.

To accomplish that, make sure the checkbox is NOT active.

NOTE: MOST of the time folks want the channel to change color on alarm, so the default setting is to have the checkbox active

How to Apply a Custom “Color Scheme”

On any “Object”, such as a Channel, simply click on the “Color Scheme” box to change the color scheme from default, to any custom color scheme you have created.

Channel 1

Display Tag: 1. Level Channel → Color Scheme: **Default**

Name for the Channel, 15 characters max.

Function: Scale Linear 2-Pt Bargraph

Input: AI-1. Level Sensor A

Units: Percent

Decimals: 2 + -

| Scale: | Input (mA) | Output (Percent) |
|--------|------------|------------------|
| 1. | 4.000 | 0.00 |
| 2. | 20.000 | 100.00 |

Cutoff: 0.00 Percent

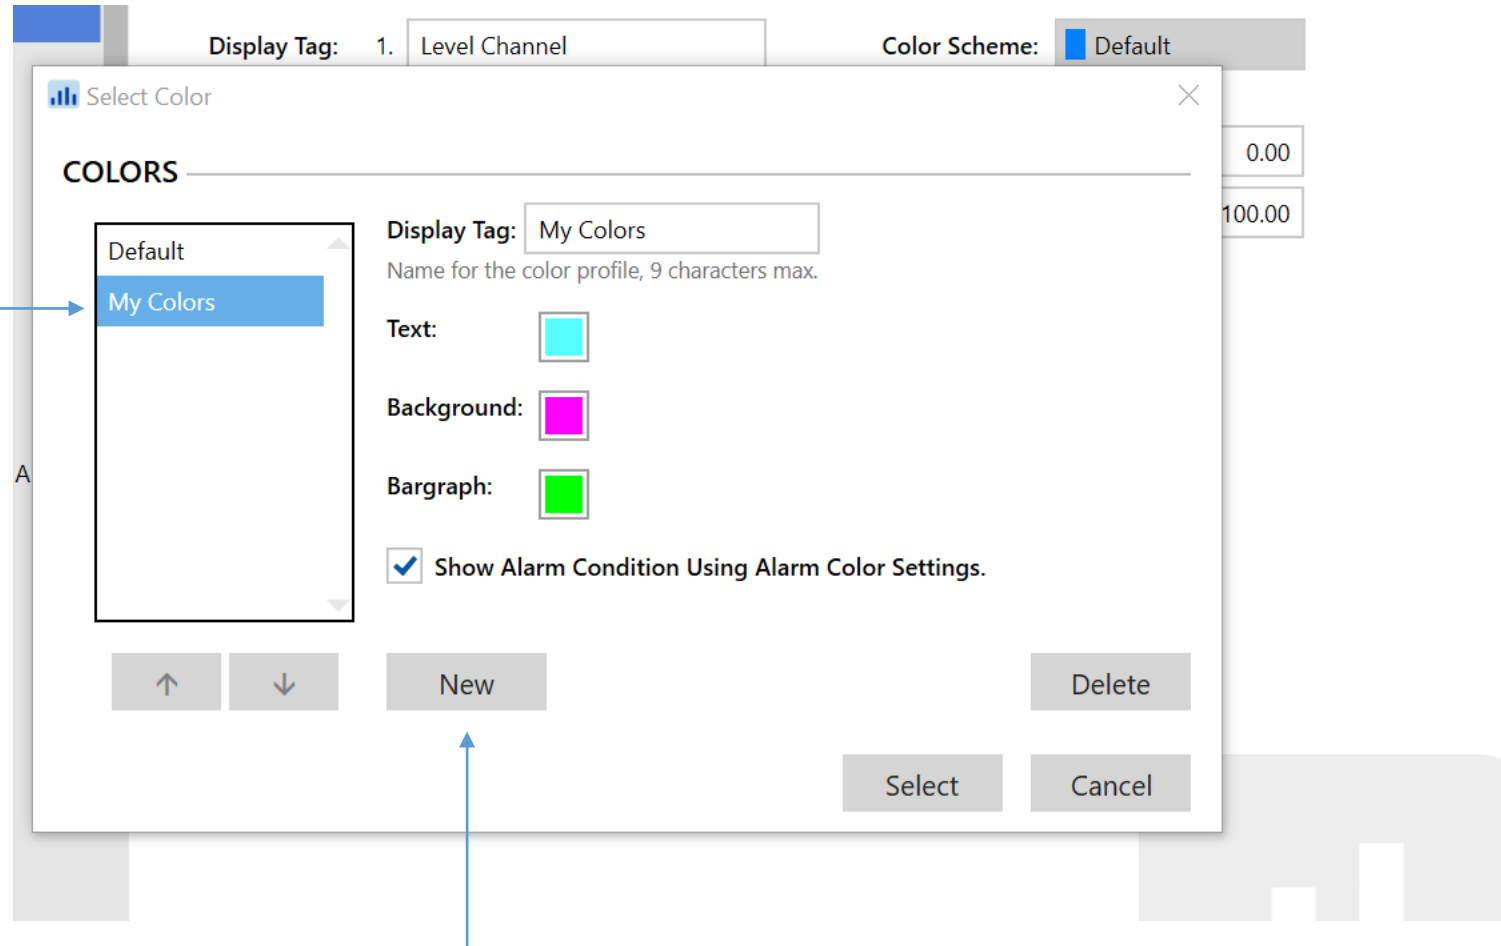

New Copy Delete

How to Apply a Custom “Color Scheme”

When you click on the “Color Scheme” button, the following screen appears.

You will notice that “My Colors” is now an option to choose!

NOTE: You can also create new color schemes directly from this screen if you are so inclined.

How to Create Timers!

As always, find “Timers” on the left of the software window, and then press “New”

The New Timer configurator will appear, and it will change DRASTICALLY depending on what you choose for an input to the timer

The screenshot shows a software interface with a sidebar on the left containing a menu: Channels, Totals, Timers (highlighted), Alarms, Inputs, Outputs, Screens, System, Production, and Sales. The main area is titled 'TIMERS SETTINGS OVERVIEW' and has a 'New' button in the top right. A 'New Timer' dialog box is open, containing the following fields and options:

- Timer:** 1. (dropdown)
- Display Tag:** Tmr1. (text input) **Name Your Timer** (text input) **Color Scheme:** Default (dropdown)
- Input:** None (text input) **Bargraph** 0% (text input) 00:00:00 (text input)
- Power Up:** Stop & Reset (dropdown) 100% (text input) 00:01:00 (text input)
- Decimals:** 0 (text input) + - (buttons)
- Count Down:** 00:00:00 (text input)
- Save** (button) **Cancel** (button)

A faint elephant logo is visible in the bottom right corner of the interface.

How to Create Timers!

For this example, we will just use our trusty, “Level Channel” as the input to this timer

Power Up: this allows you to tell the timer how to behave when power to the unit is restored. Your options are:

- Stop & Reset*
- Stop W/o Reset*
- Reset & Start*
- Start W/o Reset*

The screenshot shows the 'New Timer' configuration window with the following fields and values:

- Timer: 1.
- Display Tag: Tmr1. Name Your Timer
- Color Scheme: Default
- Input: 1. Level Channel
- Bargraph: 0% (00:00:00) to 100% (00:01:00)
- Power Up: Stop & Reset
- Error: Stay As Is
- Reset: None, 0.000 Percent
- Start: None, 0.000 Percent
- Stop: None, 0.000 Percent
- Decimals: 0
- Count Down: 00:00:00

Reset: Tells the timer at which point in your “Level Channel” scale to reset the timer

Start: Tells the timer at which point in the scale to start the timer

Stop: Tells the timer at which point in the scale to stop the timer

The choices are:

- None*
- Rising*
- Falling*
- Rising AND Falling*

How to Create Timers!

How this timer would work...

As our tank empties to 20% (*FALLING*) capacity, we want a timer to begin counting.

The timer will count continuously until our tank is filled to 90% capacity (*RISING*) at which point the timer will STOP, and display the amount of time that has elapsed

New Timer

Timer: 1

Display Tag: Tmr1. Name Your Timer

Color Scheme: Default

Name for the Timer, 15 characters max.

Input: 1. Level Channel

Bargraph 0% 00:00:00

100% 00:01:00

Power Up: Stop & Reset

Error: Stay As Is

Reset: Falling 20.000 Percent

Start: Falling 20.000 Percent

Stop: Rising 90.000 Percent

Decimals: 0 + -

Count Down: 00:00:00

Save Cancel

Coincidentally, the “Reset” point (when the timer returns to 00:00:00) is the same as our “Start” point, but it doesn’t have to be.

As our tank empties to 20% again (*FALLING*) our timer will reset.

So, it will actually reset AND start at the same exact time!

NOTE: This type of timer could be used to keep track of how long it takes to fill a tank. These times can also be data logged or could be added to another timer that keeps track of all your fill times!

How to Create Timers!

We can also have our timer count DOWN from a preset time

For example, instead of keeping track of fill time, let's say you want to make sure the tank gets filled within 10 minutes of being "empty"

The screenshot shows the 'New Timer' configuration window. The 'Timer' dropdown is set to '1.'. The 'Display Tag' is 'Tmr1.' and the 'Name Your Timer' field is empty. The 'Color Scheme' is 'Default'. The 'Input' is '1. Level Cl'. The 'Power Up' is 'Stop'. The 'Error' is 'Stay As Is'. The 'Reset' is 'Falling' with a value of '20.000' Percent. The 'Start' is 'Falling' with a value of '20.000' Percent. The 'Stop' is 'Rising' with a value of '90.000' Percent. The 'Decimals' is '0'. The 'Count Down' checkbox is checked, and the time field shows '00:00:00'. A 'Set Time' dialog box is open, showing 'Hours: 00', 'Minutes: 10', and 'Seconds: 00'. The 'Bargraph' section shows '0%' and '100%' with corresponding time values '00:00:00' and '00:01:00'. The 'Save' and 'Cancel' buttons are at the bottom right.

You simply check the "Count Down" checkbox, and then click on the editable field.

A window will pop up which will allow you to choose the starting point of our timer!

Maximum: 999:59:59

NOTE: You can make this timer the input to an alarm so that when the timer reaches "00:00:00" it can let an operator know it has taken too long to fill the tank

How to Tie a Relay Output to an Alarm

On the left side of the software window, look for “Outputs” and then for “Relay Output”

Select which physical relay you would like to tie to your alarm

6a : Relay Output

Display Tag: RY-1.

Name for the relay output channel, 15 characters max.

Input:

Fail-Safe

NOTE: *Yup... I even recommend naming your relay outputs with something meaningful. For this one, I chose “Level Ch. High” so that I know it’s for my High Alarm on my “Level Channel”*

How to Tie a Relay Output to an Alarm

You see all the different “Objects” which can be used as the input for a relay

Since I want this tied to my alarm, I am going to select the alarm we created earlier from this list of possibilities

6a : Relay Output

Display Tag: RY-1.
Name for the relay output channel, 15 characters max.

Input:

Select Source

| | |
|----------------|----------------|
| Digital Inputs | A1. Alarm Name |
| Modbus Inputs | |
| Channels | |
| Totals | |
| Timers | |
| Alarms | |
| Other | |

OK Cancel

You may be wondering, “*why don’t we just tie the relay to the ‘Level Channel’ itself instead of the alarm?!?*”

In fact, there is nothing **WRONG** with doing it that way. However, let’s say you did it that way, and totally forget to even setup an alarm.

Well, then your customer would have no visual indication of the alarm occurring on the screen!

How to Tie a Relay Output to an Alarm

Once you select the input to the relay, a few other options appear!

Enable Alternation:

This is for configuring duplex pump controllers, which will be covered in the next session

Fail-Safe: Inverts the operation of a relay in case of power failure

6a : Relay Output

Display Tag: RY-1.
Name for the relay output channel, 15 characters max.

Input:

Enable Alternation

Fail-Safe

On Delay: sec

Off Delay: sec

Pulse Output

On Time: sec

Off Time: sec

On Delay: The period of time the relay waits before it energizes when the setpoint is reached.

Off Delay: The period of time the relay waits before de-energizing (returning to its "normal state") once the reset point has been reached

Pulse Output: You are able to create a pulsed square wave with the ConsoliDator+ relay which is USUALLY used for flow

NOTE: These relays are Form C mechanical relays, and the pulse output is meant for a very slow, occasional pulse output. Mechanical relays CAN get burned out after too many cycles in a short period of time
